A company has n employees, who form a tree hierarchy where each employee has a boss, except for the general director.

Your task is to process q queries of the form: who is employee x's boss k levels higher up in the hierarchy?

Input

The first input line has two integers n and q: the number of employees and queries. The employees are numbered $1, 2, \ldots, n$, and employee 1 is the general director.

The next line has $n-1$ integers $e_2, e_3, \ldots, e_n$: for each employee $2, 3, \ldots, n$ their boss.

Finally, there are q lines describing the queries. Each line has two integers x and k: who is employee x's boss k levels higher up?

Output

Print the answer for each query. If such a boss does not exist, print -1.

Constraints

- $1 \le n, q \le 2 \cdot 10^5$
- $1 \le e_i \le i-1$
- $1 \le x \le n$
- $1 \le k \le n$

Example

Input:

```
5 3
1 1 3 3
4 1
4 2
4 3
```

Output:

```
3
1
-1
```
